## Math 676. The lattice of $S$-integers

Let $K$ be a number field, and let $S$ be a finite set of places of $K$ containing the set $S_{\infty}$ of archimedean places. Recall that we define the ring $\mathscr{O}_{K, S}$ of $S$-integers in $K$ to be the set of $a \in K$ such that $a$ is $v$-integral for all (necessarily non-archimedean!) $v \notin S$; that is, $\|a\|_{v} \leq 1$ for all $v \notin S$. For $a \in \mathscr{O}_{K, S}$, we have $a \in \mathscr{O}_{K, S}^{\times}$ if and only if $a \neq 0$ and $a, 1 / a \in K^{\times}$each lie in $\mathscr{O}_{K, S}$. That is, $a \in \mathscr{O}_{K, S}^{\times}$if and only if $a \in K^{\times}$and $\|a\|_{v},\|1 / a\|_{v} \leq 1$ for all $v \notin S$. This final condition says $\|a\|_{v}=1$ for all $v \notin S$. Hence,

$$
\mathscr{O}_{K, S}^{\times}=\left\{x \in K^{\times} \mid\|x\|_{v}=1 \text { for all } v \notin S\right\} .
$$

## 1. Preliminaries

We first wish to show that $\mathscr{O}_{K, S}$ can be concretely constructed from $\mathscr{O}_{K}$ and knowledge of the class number. For each non-archimedean place of $K$, we let $\mathfrak{p}_{v}$ denote the corresponding prime ideal of $\mathscr{O}_{K}$. Since the class group is killed by the class number, for all non-archimedean $v$ the ideal $\mathfrak{p}_{v}^{h(K)}$ in $\mathscr{O}_{K}$ is principal. Hence, the finite product $\prod_{v \in S-S_{\infty}} \mathfrak{p}_{v}^{h(K)}$ has the form $a_{S} \mathscr{O}_{K}$, so $1 / a_{S} \in K^{\times}$is non-integral at precisely those non-archimedean $v$ that lie in $S$ (if $S=S_{\infty}$ then this product is empty and we may interpret the product over the empty set $S-S_{\infty}$ to be the unit ideal $\mathscr{O}_{K} ; a_{S}$ is an element of $\mathscr{O}_{K}^{\times}$in this case). Having constructed one such element, we now show that any such element allows us to construct $\mathscr{O}_{K, S}$ as a localization of $\mathscr{O}_{K}$ :
Lemma 1.1. For $a \in \mathscr{O}_{K}-\{0\}$, we have $\mathscr{O}_{K, S}=\mathscr{O}_{K}[1 / a]$ if and only if the finite set of non-archimedean $v$ for which $\|1 / a\|_{v}>1$ is exactly the set $S-S_{\infty}$. (Equivalently, the condition is that the prime factors of $a \mathscr{O}_{K}$ are exactly the primes $\mathfrak{p}_{v}$ for $\left.v \in S-S_{\infty}\right)$.

Proof. If $\mathscr{O}_{K, S}=\mathscr{O}_{K}[1 / a]$ then $1 / a$ is $v$-integral for all $v \notin S$, so $\|1 / a\|_{v} \leq 1$ for all $v \notin S$. We wish to show that $\|1 / a\|_{v}>1$ for the other non-archimedean places, namely those $v \in S-S_{\infty}$. Suppose otherwise, so $\|1 / a\|_{v_{0}} \leq 1$ for some $v_{0} \in S-S_{\infty}$. That is, assume $1 / a$ is $v_{0}$-integral for some non-archimedean $v_{0} \in S$. Since all elements of $\mathscr{O}_{K}$ are also $v_{0}$-integral, it follows that all elements of $\mathscr{O}_{K, S}=\mathscr{O}_{K}[1 / a]$ are $v_{0}$-integral. However, this is not true: by finiteness of the class group we have $\mathfrak{p}_{v_{0}}^{h(K)}=a_{0} \mathscr{O}_{K}$ for some $a_{0} \in \mathscr{O}_{K}-\{0\}$, and clearly $1 / a_{0} \in \mathscr{O}_{K, S}$ (since $a_{0}$ is even a local unit at all places not in $S$ ) yet $1 / a_{0}$ is not $v_{0}$-integral for the place $v_{0} \in S$ (as $\left\|1 / a_{0}\right\|_{v_{0}}>1$ due to the prime factorization of $a_{0} \mathscr{O}_{K}$ ).

Conversely, suppose $a \in \mathscr{O}_{K}$ is nonzero and $\|1 / a\|_{v}>1$ for $v \in S-S_{\infty}$ and $\|1 / a\|_{v} \leq 1$ for $v \notin S$, so $\mathscr{O}_{K}[1 / a] \subseteq \mathscr{O}_{K, S}$ and we want this to be an equality. For $x \in \mathscr{O}_{K, S}$, we seek to find a large $N$ such that $a^{N} x \in \mathscr{O}_{K}$. Since $a^{N} x \in \mathscr{O}_{K, S}$ for any $N>0$, the only issue is to arrange that $a^{N} x$ is $v$-integral for each $v \in S-S_{\infty}$. Since $\operatorname{ord}_{v}\left(a^{N} x\right)=\operatorname{Nord}_{v}(a)+\operatorname{ord}_{v}(x)$ with $\operatorname{ord}_{v}(a)>0$, we can certainly find such a large $N$.

We can now make explicit how $\mathscr{O}_{K, S}$ behaves with respect to extension on $K$.
Theorem 1.2. Let $K^{\prime} / K$ be a finite extension of number fields and let $S$ be a finite set of places of $K$ containing $S_{\infty}$. Let $S^{\prime}$ be the set of places of $K^{\prime}$ lying over $S$, so $S^{\prime}$ is a finite set of places of $K^{\prime}$ containing the set $S_{\infty}^{\prime}$ of archimedean places of $K^{\prime}$.

The integral closure of $\mathscr{O}_{K, S}$ in $K^{\prime}$ is $\mathscr{O}_{K^{\prime}, S^{\prime}}$. In particular, $\mathscr{O}_{K^{\prime}, S^{\prime}}$ is a finite $\mathscr{O}_{K, S}$-module.
Proof. Choose $a \in \mathscr{O}_{K}-\{0\}$ such that for non-archimedean $v$ on $K$ we have $\|1 / a\|_{v}>1$ if and only if $v \in S-S_{\infty}$. By Lemma 1.1, $\mathscr{O}_{K, S}=\mathscr{O}_{K}[1 / a]$. Choose $x \in K$. For a non-archimedean place $v^{\prime}$ on $K^{\prime}$ over a place (necessarily non-archimedean) $v$ on $K$, clearly $x \in K^{\prime}$ is non-integral at $v^{\prime}$ if and only if $x \in K$ is non-integral at $v$. Taking $x=1 / a$, we see that for any non-archimedean $v^{\prime}$ on $K^{\prime},\|1 / a\|_{v^{\prime}}>1$ if and only if $v^{\prime} \in S^{\prime}-S_{\infty}^{\prime}$. Hence, by Lemma 1.1, $\mathscr{O}_{K^{\prime}, S^{\prime}}=\mathscr{O}_{K^{\prime}}[1 / a]$. Our problem is to show that the integral closure of $\mathscr{O}_{K}[1 / a]$ in $K^{\prime}$ is $\mathscr{O}_{K^{\prime}}[1 / a]$, and this follows from the compatibility of integral closure with respect to localization at a multiplicative set of nonzero elements of the base ring (in this case, localization at the set of powers of $a$ with non-negative exponent).

## 2. The lattice condition

Our aim is to study the geometry of the diagonal embedding

$$
\mathscr{O}_{K, S} \rightarrow \prod_{v \in S} K_{v}
$$

into the finite product of the locally compact completions $K_{v}$ of $K$ at the places $v \in S$. In the classical case $S=S_{\infty}$ this is the embedding

$$
\mathscr{O}_{K} \hookrightarrow \prod_{v \mid \infty} K_{v} \simeq \mathbf{R} \otimes_{\mathbf{Q}} K \simeq \mathbf{R}^{r_{1}} \times \mathbf{C}^{r_{2}}
$$

We have seen via a $\mathbf{Z}$-basis of $\mathscr{O}_{K}$ (and hence ultimately by the fact that $\mathbf{Z}$ is discrete in $\mathbf{R}$ and that $\mathbf{R} / \mathbf{Z}$ is compact) that $\mathscr{O}_{K}$ is discrete (hence closed) and co-compact in $\mathbf{R} \otimes_{\mathbf{Q}} K$ (that is, the quotient by $\mathscr{O}_{K}$ is compact). We claim a similar conclusion holds for general $S$ :
Theorem 2.1. The image of $\mathscr{O}_{K, S}$ in $\prod_{v \in S} K_{v}$ is a discrete (hence closed) and co-compact subgroup.
In general, a lattice $\Gamma$ in a locally compact Hausdorff topological group $G$ is a discrete subgroup such that the locally compact Hausdorff coset space $G / \Gamma$ is compact. In the special case that $G$ is a finite-dimensional $\mathbf{R}$-vector space this recovers the traditional notion of a lattice in such a vector space, and the theorem says that $\mathscr{O}_{K, S}$ is a lattice in $\prod_{v \in S} K_{v}$ in general.

Proof. Let $S^{\prime}$ be a finite set of places of $K$ containing $S$. We first show that if $\mathscr{O}_{K, S^{\prime}}$ is a lattice in $\prod_{v \in S^{\prime}} K_{v}$ then $\mathscr{O}_{K, S}$ is a lattice in $\prod_{v \in S} K_{v}$. Each valuation ring $\mathscr{O}_{v}=\mathscr{O}_{K_{v}}$ for $v \nmid \infty$ is both compact and open in $K_{v}$, so $\prod_{v \in S} K_{v} \times \prod_{v \in S^{\prime}-S} \mathscr{O}_{v}$ (with its product topology) is open and closed in $\prod_{v \in S^{\prime}} K_{v}$. This open and closed subgroup meets the diagonally embedded subgroup $\mathscr{O}_{K, S^{\prime}}$ in the set of elements of $\mathscr{O}_{K, S^{\prime}}$ whose image in $K_{v}$ lies in $\mathscr{O}_{v}$ for all $v \in S^{\prime}-S$, and these are the elements of $\mathscr{O}_{K, S^{\prime}}$ that are $v$-integral for all $v \in S^{\prime}-S$. In other words, these are the elements of $K$ that are integral at all non-archimedean places outside of $S^{\prime}$ and at all places in $S^{\prime}-S$, which is to say at all places outside of $S$ : these are the elements of $\mathscr{O}_{K, S}$. Hence, the subgroup $\mathscr{O}_{K, S^{\prime}}$ in $\prod_{v \in S^{\prime}} K_{v}$ meets the open and closed subgroup $\prod_{v \in S} K_{v} \times \prod_{v \in S^{\prime}-S} \mathscr{O}_{v}$ in exactly $\mathscr{O}_{K, S}$, and so the discreteness hypothesis for $\mathscr{O}_{K, S^{\prime}}$ implies that $\mathscr{O}_{K, S}$ has discrete image in $\prod_{v \in S} K_{v} \times \prod_{v \in S^{\prime}-S} \mathscr{O}_{v}$. We may thereby infer discreteness of $\mathscr{O}_{K, S}$ diagonally embedded in $\prod_{v \in S} K_{v}$ via:
Lemma 2.2. Let $G$ and $G^{\prime}$ be Hausdorff topological groups with $G^{\prime}$ compact. Let $\Gamma$ be a discrete subgroup of $G \times G^{\prime}$ such that the map $\Gamma \rightarrow G$ is injective. The image of $\Gamma$ in $G$ is discrete.

Proof. We will argue with the language of nets, but the reader who prefers to use sequences to probe the topology of a space may safely impose the condition that $G$ and $G^{\prime}$ have a countable base of opens around each point (which certainly holds for metrizable spaces, the intended application). Let $\pi: G \times G^{\prime} \rightarrow G$ be the projection. Suppose that $\Gamma$ does not have discrete image in $G$, so there exists $\gamma \in \Gamma$ such that $\pi(\gamma)$ is a limit of a net $\left\{\pi\left(\gamma_{i}\right)\right\}$ where the $\gamma_{i}$ 's lie in $\Gamma-\{\gamma\}$. Consider the net $\left\{\gamma_{i}\right\}$ in $\Gamma \subseteq G \times G^{\prime}$. Since $G^{\prime}$ is compact Hausdorff, by passing to a subnet we may arrange that the image of $\left\{\gamma_{i}\right\}$ in $G^{\prime}$ has a limit. By hypothesis the image of $\left\{\gamma_{i}\right\}$ in $G$ has a limit, namely $\gamma$. Hence, the net $\left\{\gamma_{i}\right\}$ has a limit under projection to each factor and so has a limit in $G \times G^{\prime}$. By discreteness of $\Gamma$ in $G \times G^{\prime}$, the net must be eventually constant, and so the net $\left\{\pi\left(\gamma_{i}\right)\right\}$ in $G$ is eventually constant. Its limit is $\pi(\gamma)$, so $\pi\left(\gamma_{i}\right)=\pi(\gamma)$ for large $i$. By the hypothesis of injectivity for $\pi$ we conclude $\gamma_{i}=\gamma$ for large $i$, a contradiction.

We conclude that discreteness for $\mathscr{O}_{K, S}$ in $\prod_{v \in S} K_{v}$ is a consequence of the assumed discreteness for $\mathscr{O}_{K, S^{\prime}}$ in $\prod_{v \in S^{\prime}} K_{v}$. By closedness of discrete subgroups, the quotients $\left(\prod_{v \in S} K_{v}\right) / \mathscr{O}_{K, S}$ and $\left(\prod_{v \in S^{\prime}} K_{v}\right) / \mathscr{O}_{K, S^{\prime}}$ are locally compact Hausdorff topological groups and we wish to show that compactness of the latter implies compactness of the former. Consider the natural continuous map (using quotient topologies)

$$
j:\left(\prod_{v \in S} K_{v} \times \prod_{v \in S^{\prime}-S} \mathscr{O}_{v}\right) / \mathscr{O}_{K, S} \rightarrow\left(\prod_{v \in S^{\prime}} K_{v}\right) / \mathscr{O}_{K, S^{\prime}}
$$

This is clearly injective, and if we can prove it is a closed embedding then the source is compact and so its image $\left(\prod_{v \in S} K_{v}\right) / \mathscr{O}_{K, S}$ under projection to the $S$-factors is certainly compact as desired. Since the source
and target of $j$ are quotients by discrete subgroups, the map $j$ is locally (on source and target) an open embedding because the map $\prod_{v \in S} K_{v} \times \prod_{v \in S^{\prime}-S} \mathscr{O}_{v} \rightarrow \prod_{v \in S^{\prime}} K_{v}$ is certainly an open embedding. It is elementary definition-chasing to check that continuous map that is locally an open embedding is an open embedding if and only if it is injective, so by injectivity of $j$ we can indeed deduce the lattice property for $S$ if we have it for some $S^{\prime}$ containing $S$.

Now we use the preceding considerations with a suitable $S^{\prime} \supseteq S$ to increase $S$ to be the preimage of a finite set of places of $\mathbf{Q}$ (containing the archimedean place), and so (by Theorem 1.2) $\mathscr{O}_{K, S}$ is the integral closure of $\mathbf{Z}[1 / N]$ in $K$ for a suitable nonzero integer $N$, so $\mathscr{O}_{K, S}=\mathscr{O}_{K}[1 / N]$. For $S_{0}=\{\infty, p \mid N\}$ we have

$$
\prod_{v \in S} K_{v}=\prod_{v_{0} \in S_{0}}\left(\prod_{v \mid v_{0}} K_{v}\right) \simeq \prod_{v_{0} \in S_{0}} K \otimes_{\mathbf{Q}} \mathbf{Q}_{v_{0}} \simeq K \otimes_{\mathbf{Q}} \prod_{v_{0} \in S_{0}} \mathbf{Q}_{v_{0}}
$$

Since $K=\mathscr{O}_{K}[1 / N] \otimes_{\mathbf{Z}[1 / N]} \mathbf{Q}$, we get a natural isomorphism

$$
\phi: \mathscr{O}_{K}[1 / N] \otimes_{\mathbf{Z}[1 / N]} \prod_{v \in S_{0}} \mathbf{Q}_{v} \simeq \prod_{v \in S} K_{v}
$$

Since $\mathbf{Z}[1 / N]$ is a PID we may find a free basis for $\mathscr{O}_{K}[1 / N]$ as a $\mathbf{Z}[1 / N]$-module, and it is a simple exercise (check!) that using any such choice of basis to identify the source of $\phi$ with a product of copies of $\prod_{v_{0} \in S_{0}} \mathbf{Q}_{v_{0}}$ makes $\phi$ into a topological isomorphism. Hence, upon picking such a basis we may reduce the problem of discreteness and co-compactness for $\mathscr{O}_{K}[1 / N]$ in $\prod_{v \in S} K_{v}$ to the problem of discreteness and co-compactness for $\mathbf{Z}[1 / N]$ in $\prod_{v_{0} \in S_{0}} \mathbf{Q}_{v_{0}}$. This completes the reduction of our problem to the case of the field $\mathbf{Q}$.

To check discreteness in the case $K=\mathbf{Q}$ (with $\mathscr{O}_{K, S}=\mathbf{Z}[1 / N]$ for a suitable nonzero integer $N$ ) we observe that $(-1,1) \times \prod_{p \mid N} \mathbf{Z}_{p}$ is an open neighborhood of the origin in $\prod_{v \in S} \mathbf{Q}_{v}$ that meets $\mathscr{O}_{K, S}=\mathbf{Z}[1 / N]$ in the set of elements $x \in \mathbf{Z}[1 / N]$ that are $p$-integral for all $p \mid N$ and satisfy $|x|<1$. The $p$-integrality for all $p \mid N$ says exactly $x \in \mathbf{Z}$, and clearly if $x \in \mathbf{Z}$ and $|x|<1$ then $x=0$. This proves discreteness. For co-compactness it suffices to prove that the natural continuous map

$$
[0,1] \times \prod_{p \mid N} \mathbf{Z}_{p} \rightarrow\left(\prod_{v \in S} \mathbf{Q}_{v}\right) / \mathbf{Z}[1 / N]
$$

with compact source is surjective. Pick an element $x \in \prod_{v \in S} \mathbf{Q}_{v}$. Every element of $\mathbf{Q}_{p} / \mathbf{Z}_{p}$ admits a representative of the form $a_{p} / p^{e_{p}}$ with $e_{p} \geq 0$ and $a_{p} \in \mathbf{Z}$, and so by subtracting an element of the form $\sum_{p \mid N} a_{p} / p^{e_{p}} \in \mathbf{Z}[1 / N]$ we can find a representative for $x \bmod \mathbf{Z}[1 / N]$ that lies in $\mathbf{R} \times \prod_{p \mid N} \mathbf{Z}_{p}$. Adjusting by a further element of $\mathbf{Z}$ (diagonally embedded) allows us to find a representative for $x \bmod \mathbf{Z}[1 / N]$ lying in $[0,1] \times \prod_{p \mid N} \mathbf{Z}_{p}$ as desired.
