## TOPOLOGICAL QUANTUM FIELD THEORY AND THE GROMOV-WITTEN THEORY OF CURVES IN CALABI-YAU THREEFOLDS

JIM BRYAN

University of British Columbia

### Abstract:

Topological Quantum Field Theory, as formulated by Atiyah, has provided a general framework for understanding invariants of manifolds. The structure of TQFTs in dimension 1+1 (i.e. surfaces with boundaries) is completely understood by elementary means — yet they can still yield surprising results. For each positive integer  $d$ , we define a one-parameter family of 1+1 dimensional TQFTs  $Z_d(t)$  which specializes at  $t = 0$  to the famous Witten-Dijgraaf-Freed-Quinn TQFT for gauge theory with finite gauge group  $S_d$  (the  $d$ th symmetric group). Our family of TQFTs completely encodes all the degree  $d$  local Gromov-Witten invariants of a curve (of arbitrary genus) in a Calabi-Yau threefold. This provides us with a “structure theorem” for these local invariants (a.k.a. multiple cover formulas). As an application we use our theorem in combination with a conjecture from physics (the Gopakumar-Vafa conjecture) to completely determine the local invariants for  $d = 1, 2$ , and  $3$ .
